ResuME

Milestone 2: User Interface Implementation
Progress Report

Nolasco, Bonita, Masillones

November 4, 2026

What was completed

- All 16 screens. Welcome, Timeline, Add/Edit Entry and also including Add Past Achievement, Description Suggestion, Entry Details, Scan Certificate, AI Notice, Resumes, Create Resume, Job Posting Suggestions, Resume Preview, Certificates, Settings, Profile, Reminders, and Backup and Restore.
- Added Navigation. Welcome shows once and is never shown again. The bottom bar appears on main screens only. Every other screen has a back arrow and the Android back button works the same way.
- Forms and input. Title, category, and date are required on Add/Edit Entry, with inline error messages. The semester is suggested from the date. Create Resume needs a version name and at least one ticked entry. Profile checks the email format.
- Interactive elements. The category options, the OJT/Scholarship/job selector, template picker, entry checklists, reminder toggles, confirmation dialogs for delete and restore, and short toast messages.
- Behavior from the plan. Entries are grouped by school year and semester with the newest first. Entries without proof are greyed out on the Certificates screen. The resume preview changes with the chosen template.
- Offline behavior. The AI buttons are turned off and a small notice appears when there is no connection. The AI Notice shows before the first AI use.
- Design consistency and responsiveness. ResuME uses one navy color theme, the inter font, bootstrap 5 and bootstrap icons.

What remains to be developed

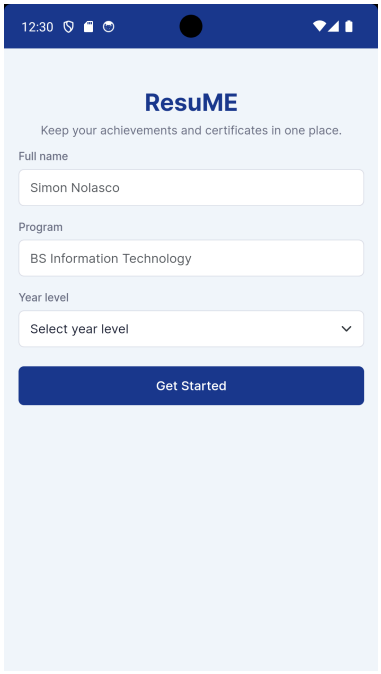

- Database. Replace local storage with the SQLite tables and the data layer which will be handled in Week 2 to 3 plan.
- Proof storage. Real camera and file picker through the Cordova plugins, saving proof files in the app folder, and the proof viewer to be done during week 4.
- Reminders. Semester end-date notifications using Local Notification to be done during Week 5.

- PDF, export, and backup. PDF resume generation, the combined certificate PDF, and the backup and restore file to be done during Weeks 5 to 6. The PDF, Share, Export, Create Backup, and Restore buttons are in place but show a short message for now.
- AI features. Connecting the Gemini API for Certificate Scan, Description Improver, and Job Posting Suggestions to be completed during weeks 7 to 8. The AI screens currently use sample results so the design can be reviewed.
- Testing. Testing on real phones with sample certificates, with internet off, and with a few students to be tested on week 9.

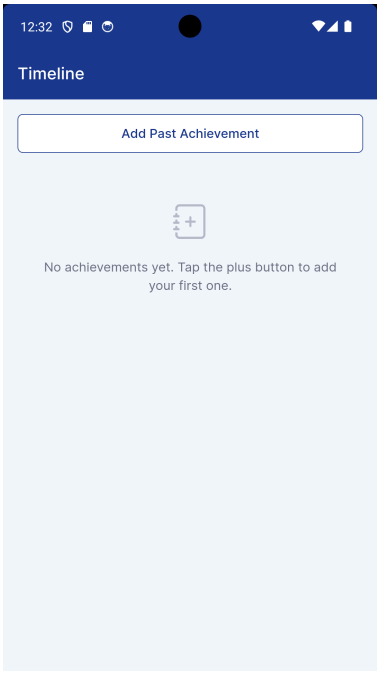

Problems encountered and how they were addressed

- Java version conflict.The computer had Java 19 and 20, but Cordova needs JDK 17. We installed JDK 17 and set JAVA_HOME to it, and the build succeeded.
- Old data stayed after reinstalling. The app skipped the Welcome screen because the previous data was still saved on the emulator. We cleared the app's data to test it again.
- The camera photo didn't display in the emulator. After taking a photo with the emulator's simulated camera, the Scan Certificate screen showed a broken image. The screen shows the real camera and buttons work, so we will test it on a real phone or the emulator and fix it in the next milestone.

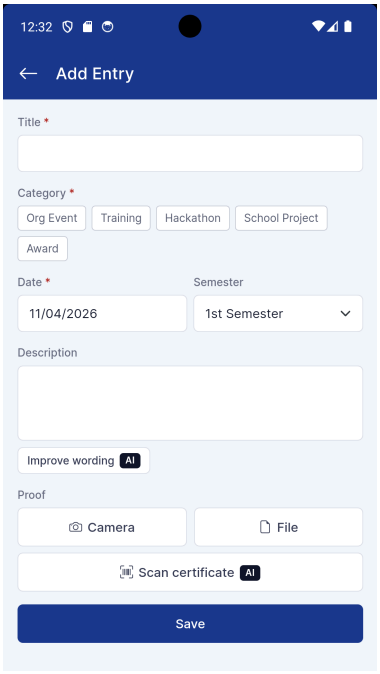

Screenshots of implemented screens

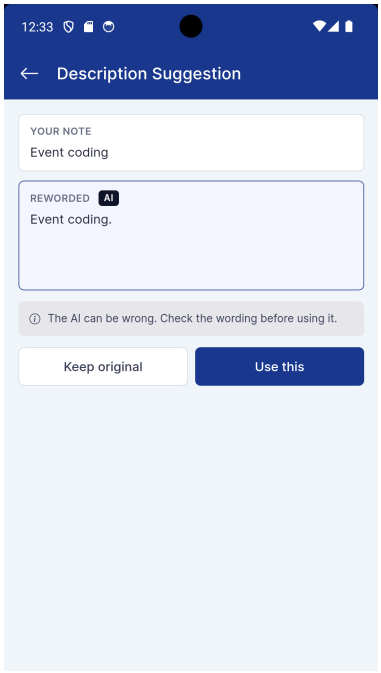

1. Welcome

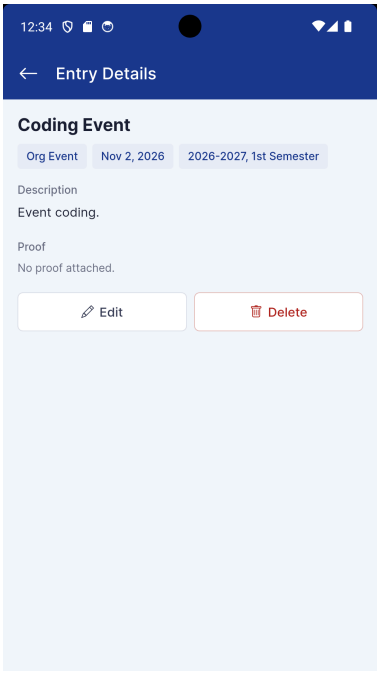

2. Timeline

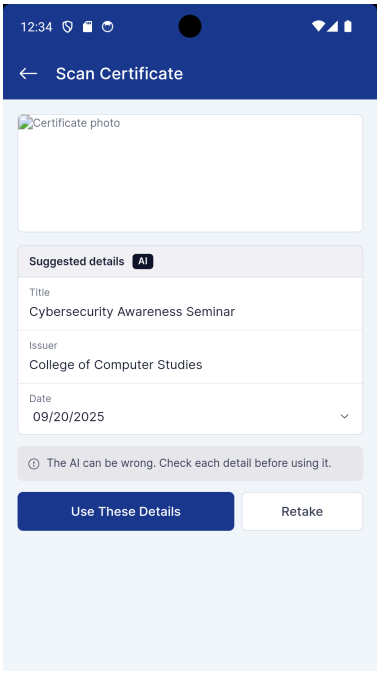

3. Add / Edit Entry

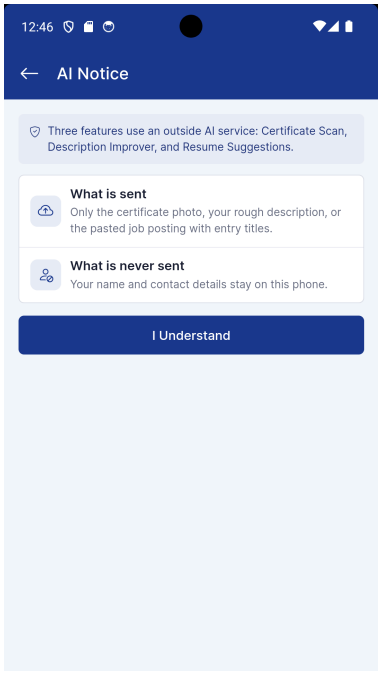

4. Description Suggestion

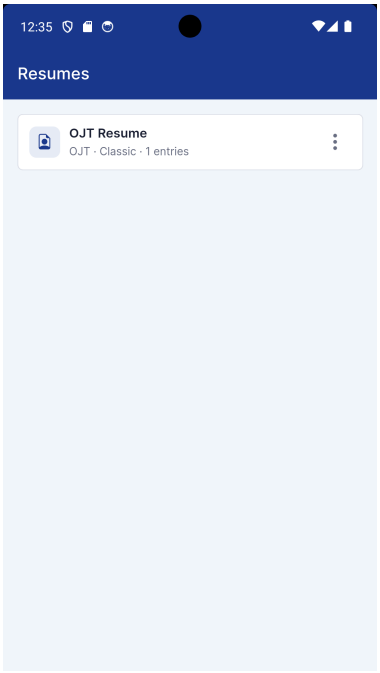

5. Entry Details

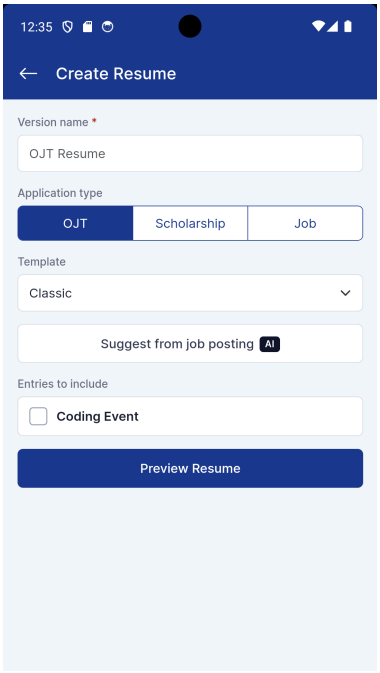

6. Scan Certificate

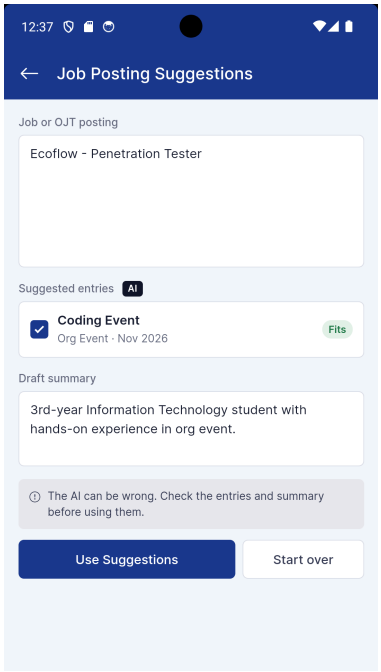

7. AI Notice

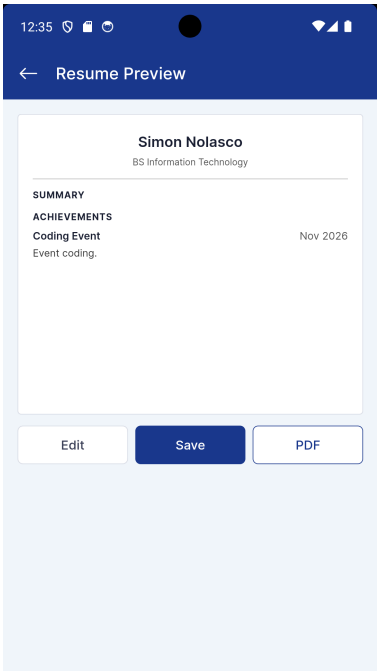

8. Resumes

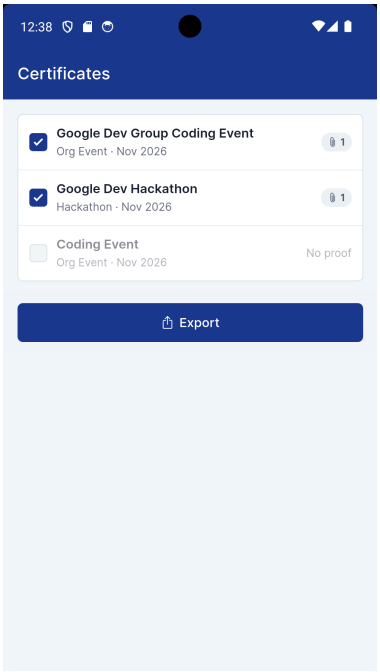

9. Create Resume

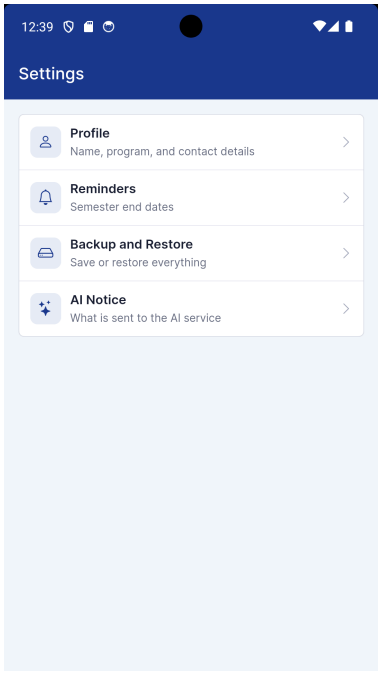

10. Job Posting Suggestions

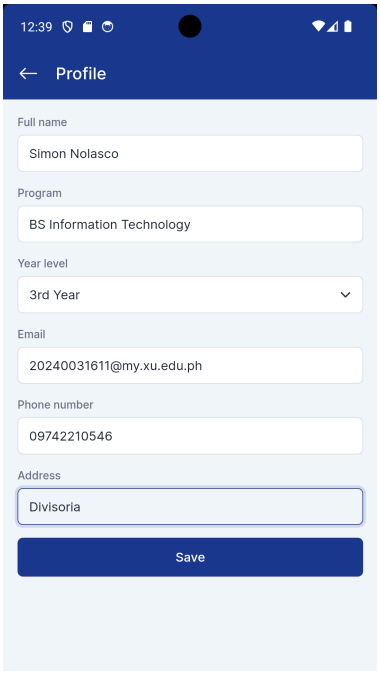

11. Resume Preview
