ResuME: Core Functionality Development Progress Report

1. Weekly Check-in

The application does more than look complete; its main functions are working. The profile and the entries can be filled in and saved, and the work on proof files and resumes is already ahead of the plan. The AI features come in Weeks 7 and 8.

2. Completed Features

- **Member 1:** SQLite storage was added for entries, profile information, and settings. The data loads when the app opens and saves after every change, and it is still there after the app is closed and reopened.
- **Member 2:** Welcome and Profile screens save the name, program, year level, email, phone, and address. Empty fields and a wrong email show a message.
- **Member 3:** The Timeline and Entry Details read the saved entries from the database. Attached images and PDFs open in the proof viewer.
- **Member 2:** Add/Edit Entry and Add Past Achievement save an entry with its title, category, date, semester, and description. Only title, category, and date are required.
- **Member 2:** Entries, resumes, and the profile are connected to the SQLite database.

Done ahead of the plan (These features were finished ahead of the original plan.)

- **Member 2:** Camera and file picker of Week 4. A photo, an image, or a PDF can be attached to an entry. The file is saved in the app and shown as a tag.
- **Member 2:** Create Resume of Week 5. A resume version is saved with its name, type, template, and picked entries.
- **Member 2:** Resume Preview and PDF generation of Week 6. The preview has an editable summary, and the PDF button makes an A4 PDF in the classic, modern, or compact template and opens it on the phone.

3. Features Currently Being Developed

Week 4: Proof Attachment

- **Member 1:** Save proof files in the app folder and link them to entries

4. Remaining Features

Week 5: Reminders and Resume start

- **Member 1:** Reminders screen and semester notifications

Week 6: Resume, Export, and Backup

- **Member 1:** Backup and restore file
- **Member 2:** Sharing a resume PDF. The Share option still shows a message that it is not ready.
- **Member 3:** Certificates screen and combined certificate PDF

Week 7: AI part 1

- **Member 1:** AI module, API key config, and internet check.

- **Member 2:** AI Notice and Description Improver. The screens are built, but the AI is not connected yet.
- **Member 3:** Scan Certificate screen and scan later.

Week 8: AI part 2 and Polish

- **Member 1:** Resume Suggestions.
- **Member 2:** AI buttons turned off when offline. They already switch off in the screens and still need a check with the real AI.
- **Member 3:** Layout fixes on a real phone.

Week 9: Testing and Documentation

- **All members:** Testing and documentation.

5. Problems Encountered

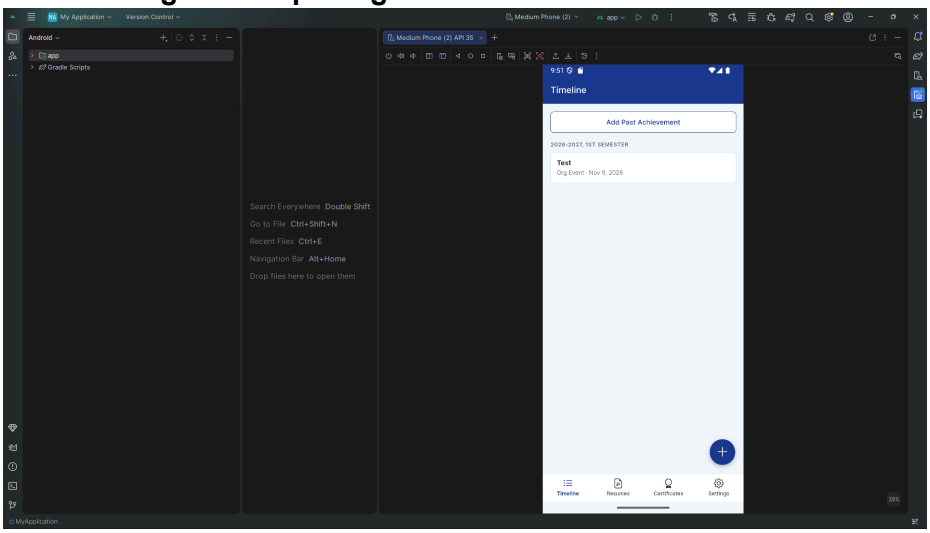

- **Member 1:** The app needed a way to store entries, profile information, and settings persistently on the device.
- **Member 2:** A photo taken with the emulator camera did not attach to the entry, and the preview showed a broken image.
- **Member 2:** The PDF button did nothing when it was first tried.
- **Member 2:** The emulator had no files to pick as proof.
- **Member 3:** The Timeline and Entry Details were not displaying entries loaded from SQLite, and attached proofs could not be opened for viewing.

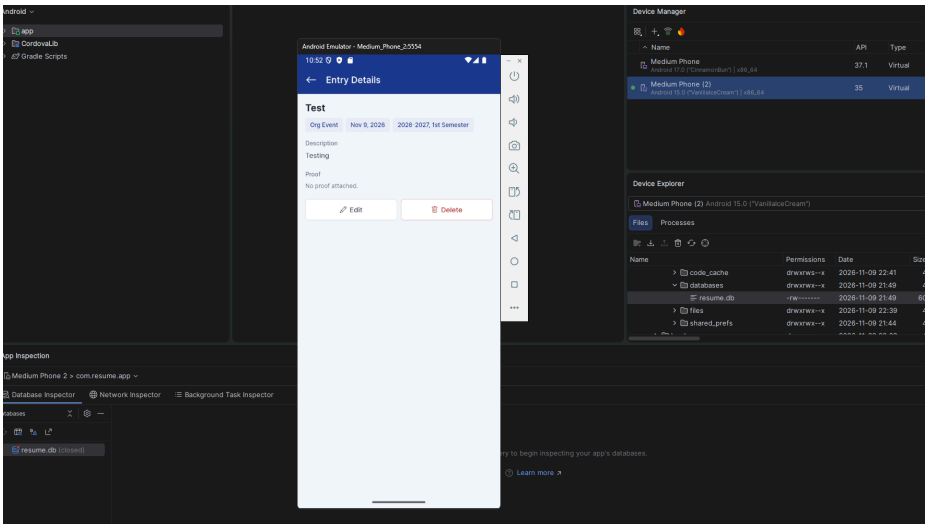

6. Solutions Implemented

- **Member 1:** SQLite storage was added for entries, profile information, and settings so the app can save and load this data on the device.
- **Member 2:** The app now asks the camera to save the photo as a file and reads that file, instead of receiving the picture as text. The photo is attached after this change.
- **Member 2:** The PDF library file had the wrong name, so the app could not find it. After the name was corrected, the PDF opened.
- **Member 2:** A PDF and an image were dragged onto the emulator so the file picker had something to choose.
- **Member 3:** The app now loads saved data from SQLite before displaying the Timeline and Entry Details. Proof attachments can be opened in a viewer.

Lab - Attacking a mySQL Database

Objectives

In this lab, you will view a PCAP file from a previous attack against a SQL database.

Part 1: Open Wireshark and load the PCAP file.

Part 2: View the SQL Injection Attack.

Part 3: The SQL Injection Attack continues…

Part 4: The SQL Injection Attack provides system information.

Part 5: The SQL Injection Attack and Table Information

Part 6: The SQL Injection Attack Concludes.

Background / Scenario

SQL injection attacks allow malicious hackers to type SQL statements in a web site and receive a response from the database. This allows attackers to tamper with current data in the database, spoof identities, and miscellaneous mischief.

A PCAP file has been created for you to view a previous attack against a SQL database. In this lab, you will view the SQL database attacks and answer the questions.

Required Resources

- CyberOps Workstation virtual machine

Instructions

You will use Wireshark, a common network packet analyzer, to analyze network traffic. After starting Wireshark, you will open a previously saved network capture and view a step by step SQL injection attack against a SQL database.

Part 1: Open Wireshark and load the PCAP file.

The Wireshark application can be opened using a variety of methods on a Linux workstation.

a. Start the CyberOps Workstation VM.

b. Click **Applications > CyberOPS > Wireshark** on the desktop and browse to the Wireshark application.

c. In the Wireshark application, click **Open** in the middle of the application under Files.

d. Browse through the **/home/analyst/** directory and search for **lab.support.files**. In the **lab.support.files** directory and open the **SQL_Lab.pcap** file.
